V2.2

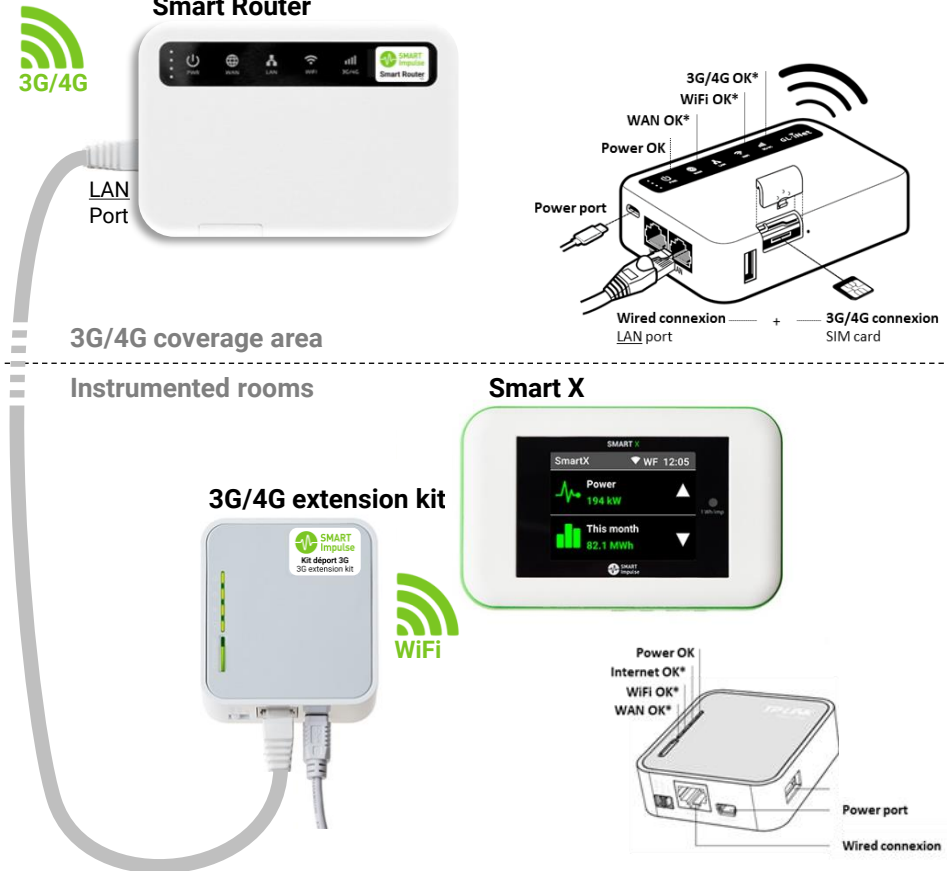

## SETUP

When the 3G/4G coverage is not sufficient in the analysed switchrooms (ex: basement), the 3G/4G extension kit enables to **move the Smart Router to a zone with a higher coverage** (ex: ground floor).

To install it:

- **Plug in the Smart Router** delivered with the Smart X® ("Smart Router v2" label) in the nearest area with sufficient 3G/4G coverage. The 3G/4G LED should light up.
- **Plug in the 3G/4G Extension Kit** ("3G extension kit" label) close to the Smart X installed.
- **Connect one router to the other with the Ethernet cable** (length 30 metres, to connect to the 'LAN' port of the Smart Router).

After 2 minutes, the Smart X units pair automatically to the Smart Router and can communicate with the Smart Impulse server (📶 icon on the Smart X screen).

\*Solid: connected, Blinking: connected + data transfer in progress
